

## **Water Management Practices**

Last Updated: March 2025

Fresh water is a valuable shared resource, and we monitor our usage, reuse what we can, and divert the rest as to not contaminate fresh water supplies. As part of our environmental efforts, we are mindful of water withdrawal in our business operations.

Our commitment to water stewardship is achieved in the following ways:

- Screening our key manufacturing facilities using the Aqueduct™ Water Risk Atlas tool to determine if any operations occur in high water-stressed or scarce locations to understand potential impacts and manage appropriately.
- Using minimal water consumption during the manufacturing process.
- Reducing water consumption in our facilities by implementing water saving devices, rainwater collection, low irrigation landscaping and using recycled water for irrigation where possible.
- Complying with all local, state, national, and international laws regarding water discharge to mitigate any contamination of bodies of water.
- Engineering our materials to have minimal impact on the environment after their life cycle is complete.
- Educating our customers about proper material handling and disposal.
- Through our Supplier Code of Conduct, ensuring our suppliers comply with applicable safe drinking water laws and regulations.

3D Systems employees are responsible to understand and support our water policy for the preservation of this natural resource.
